

Answers to common questions:

Why are you currently on the job market and what is your target salary?

I was laid off in December due to lack of work in North America. My salary was \$172k annually. I'm currently seeking a salary in the \$140 - \$170k range.

Tell me about your experience working with early stage startups and/or companies/personal projects you've started.

Experience with Startups:

I have experience with several startups including Platinion - a startup offshoot of Boston Dynamics, Doremus Advertising Digital department, and McQuarter Group - a hybrid advertising and PR firm, producing online media. I've also worked as a self directed freelancer for over ten years (ddworks.org) - and I've built several fullstack apps that I publish using AWS cloud hosting - (<https://bartdorityportfolio.online/>)

Please describe the core tech stack you have worked with over the last 3-5 years:
Over the past several years, my primary focus has been on developing modern web applications using a robust front-end stack centered around React and TypeScript. I leverage React's component-based architecture to build scalable, maintainable interfaces, while TypeScript provides strong typing and improved code reliability. I frequently use Material UI and Sass to create visually consistent, responsive designs that align with brand guidelines and enhance user experience. On the back end, I've worked extensively with Node.js to build RESTful APIs, handle server-side logic, and integrate with databases and third-party services. Together, this stack has enabled me to deliver high-quality, full-stack solutions that are both efficient and user-friendly.

What is your most impressive career accomplishment related to front end development
I successfully architected and produced several core features of the enterprise scale web application of a major US bank. As the UI lead for the information reporting pod, I built custom complex and highly customizable financial reports for clients each with hundreds of accounts. The UI components were built in a scalable, reusable manner and I managed a team of four developers with on a monthly release schedule.

Please describe your experience with AI prompting, models and tools

I have been using AI tools for generative AI and coding assistance for over two years. I use Claude-Code, Antigravity, ChatGPT, Gemini, Claude, and Perplexity regularly. I completed a weekend AI Mastermind course on Generative AI from Outskill.com. I completed a 14 day AI accelerator program for engineers. And as a proof of concept - I built a custom agentic RAG AI pipeline for my portfolio: <https://bartdorityportfolio.online/> You can ask it questions about my skills and experience. It has a document processing pipeline built with Python, that takes a series of documents that I have written and embeds them using an embedding model from Hugging Face. It then stores those chunks in a Lance DB vector database. Then when a user asks a question, the API sends the query to an agentic pipeline built with LangGraph where it embeds the query using the same embedding model, and then finds the relevant chunks that I've written about my work history and sends them to an LLM with a strict

system prompt to be able to answer the query - with only factual information as the source material. I'm also currently enrolled in the Outskill fellowship program for AI professionals which is a 6 month course, covering all the latest techniques.

Experience with UI State Management:

I am well versed in UI state management using various techniques and libraries such as Redux, Zustand, MobX, and building custom solutions, for global state management, server/cache state, form state, and complex workflows. The bulk of my experience has been using MobX, using observable maps, objects and arrays. I have used MobX for over 5 years for a complex financial reporting application of a major US Bank.

Experience with building modern web interfaces:

I'm a front-end-focused full-stack developer with experience in Vue, React, and Angular. I have built several projects using Angular, including an entire Learning Management System. However, React is my primary framework of choice, and it's where I've built the majority of my experience.

Experience designing and building APIs:

I have extensive experience designing and building robust, scalable RESTful API systems using Node.js, Express, TypeScript, and LoopBack. My work emphasizes clean architecture, strong typing, and precise data-contract construction in TypeScript to ensure consistency across services. I also develop custom middleware functions for intelligent data mapping and transformation, maintaining smooth communication between clients and backend modules. While most of my professional work centers on RESTful APIs, I've also explored GraphQL in personal projects and appreciate its flexibility and efficiency in handling complex data queries.

Experience with CI/CD Pipelines and Deployments:

During my time at Grid Dynamics, I gained extensive hands-on experience with CI/CD pipelines, particularly through GitHub Actions and GitLab. Working within a large, multi-repository codebase, I maintained YAML-based configuration files and feature flag settings while regularly committing, merging, and reviewing code as part of a front-end development team. We operated in two-week sprints and deployed updates to an AWS Kubernetes environment monthly, managing four distinct repositories covering the UI, middleware, and configuration layers. Over six years, I consistently ranked among the top contributors across a combined team of over 100 developers, helping ensure smooth and reliable deployment processes throughout each release cycle.

Experience with CSS:

I bring extensive experience in crafting and refining CSS for websites and applications, with a strong command of modern layout techniques—including Grid, Flexbox, and responsive breakpoints. I'm adept at developing scalable style architectures using Sass, leveraging variables and color transformations to maintain consistency and flexibility across projects. My work integrates thoughtful use of color and typography to strengthen brand identity and deliver visually cohesive user experiences. In addition, I'm skilled in applying CSS resets and normalization strategies and fluent in frameworks such as Bootstrap,

ensuring polished, cross-browser designs optimized for every device.

Experience with Python, LangChain, LangGraph, FastAPI, LlamaIndex, Ollama, and RAG systems:

I've used Python extensively for both applied AI systems and interactive scientific simulations. Most recently, I built a **custom Retrieval-Augmented Generation (RAG) system** to power agentic AI pipelines on my portfolio website. This system integrates **LangChain, LangGraph, LlamaIndex, FastAPI, Hugging Face, Ollama, and OpenRouter** to deliver intelligent, context-aware responses about my background and skills. Using Python, I designed a preprocessing pipeline that tokenizes, chunks, and embeds curated documents—such as my CV and project write-ups—storing them in a **LanceDB** vector database. My LangGraph-based agent then orchestrates retrieval and generation calls, ensuring the model answers recruiter queries factually and consistently while minimizing hallucination risks. In addition, I designed a second agentic pipeline, **FitCheck**, that evaluates my fit for specific job descriptions. It extracts key technical signals from postings, embeds them, retrieves matching content from the knowledge base, and computes a structured fit assessment—complete with scores, strengths, and potential gaps. This modular architecture demonstrates my experience in orchestrating multi-step, LLM-driven workflows and building practical AI systems using modern Python frameworks.

Earlier in my technical journey, I developed a **3D animated Newtonian physics simulator** in Python as a demonstration project for a college physics course. That project combined computational modeling, animation, and physics visualization—bridging science, engineering, and programming. I plan to resurrect and expand that project soon as an exploration of visualization in education and interactive simulation.

Staff or Tech-Lead role:

As a longtime UI team lead at Grid Dynamics, I directed a team of 4–5 developers within the information-reporting pod, guiding feature rollouts across design, backend, product, and QA teams in a Scrum-based Agile environment. I co-authored and planned user stories, coordinated cross-pod projects, and regularly contributed to sprint planning and progress reviews. A natural mentor, I took pride in developing talent through pair programming, detailed merge request feedback, and clear explanations of complex architectural concepts. My leadership style emphasizes clarity, collaboration, and technical excellence. In addition to this recent hands-on technical leadership, I bring broader management experience from earlier creative and technical leadership roles overseeing multidisciplinary development teams delivering large-scale digital solutions for enterprise clients.
